

Sample Collection Kits

Medical professionals are often dependent on laboratories to make and/or confirm a diagnosis. Doctors may take different samples from a patient: blood, cerebrospinal fluid, faeces, urine, skin, saliva.

For each specimen a dedicated sample collection kit was developed which MEG has been supplying since 2010. One of the modules is a transport module, containing products that help the medical professional

to send samples in a proper way to a laboratory. It includes e.g. vaccine carriers, special insulated carton boxes, a transport box for infectious substances and a dry ice maker.
